In continuum mechanics, stress is a physical quantity that expresses the internal forces that neighboring particles of a continuous material exert on each other, while strain is the measure of the deformation of the material. For example, when a solid vertical bar is supporting an overhead weight, each particle in the bar pushes on the particles immediately below it.

In linear algebra, an eigenvector or characteristic vector of a linear transformation is a non-zero vector that changes by only a scalar factor when that linear transformation is applied to it. More formally, if  $T$  is a linear transformation from a vector space  $V$  over a field  $F$  into itself and  $v$  is a vector in  $V$  that is not the zero vector, then  $v$  is an eigenvector of  $T$  if  $T(v)$  is a scalar ...
