

cellulose and wood chemistry pdf

Cellulose is an organic compound with the formula $(C_6H_{10}O_5)_n$, a polysaccharide consisting of a linear chain of several hundred to many thousands of $\beta(1\rightarrow4)$ linked D-glucose units. Cellulose is an important structural component of the primary cell wall of green plants, many forms of algae and the oomycetes. Some species of bacteria secrete it to form biofilms.

Cellulose - Wikipedia

Wood, in the strict sense, is yielded by trees, which increase in diameter by the formation, between the existing wood and the inner bark, of new woody layers which envelop the entire stem, living branches, and roots. This process is known as secondary growth; it is the result of cell division in the vascular cambium, a lateral meristem, and subsequent expansion of the new cells.

The dissolution mechanism of cellulose in ILs has been extensively investigated to improve the dissolution capacity. Studies on the mechanism of the cellulose dissolution in ILs have indicated that interactions between the IL anions and the hydroxyls of cellulose play an important role in this process, and requirements of hydrogen bonding acceptor ability (or basicity) of the anion has been ...
