RANKS OF TWISTS OF ELLIPTIC CURVES 3 Theorem 1.5. Suppose K is a number field, and E is an elliptic curve over K such that $E(K)[2] = 0$. Suppose further that either K has a real embedding, or that E has multiplicative reduction at some prime of K .

A heuristic for boundedness of ranks of elliptic curves

Any elliptic curve E over k is isomorphic to the curve in P^2_k defined by some generalised Weierstrass equation, with the base point O of E being mapped to $(0 : 1 : 0)$. Conversely any non-singular generalised Weierstrass equation defines an elliptic curve, with this choice of basepoint. Proposition 1.6.

1 INTRODUCTION TO ELLIPTIC CURVES May 1992 The theory developed here is embodied in a computer program which computes the rank of elliptic curves. I used this program to estimate the rank of over 100,000 elliptic curves. Much has been made of Mazurâ€™s description of such a process, in which one computes descents by day and images by night [Tat].

of the elliptic curves over \mathbb{Q} have rank 0, density $\frac{1}{2}$ have rank 1, and the density of elliptic curves over \mathbb{Q} with rank ≥ 2 is zero. Many people believe that ranks of elliptic curves over \mathbb{Q} are unbounded. There are similar questions about elliptic curves over other number fields. 6. In other words, half of all elliptic curves should have rank 0 (meaning that the infinite part of its Mordell-Weil group is trivial) and the other half should have rank 1; all remaining ranks consist of a total of 0% of all elliptic curves.
