The study of Riemannian geometry is rather meaningless without some basic knowledge on Gaussian geometry i.e. the geometry of curves and surfaces in 3-dimensional Euclidean space. For this we recommend the following text: M. P. do Carmo, Differential geometry of curves and surfaces, Prentice Hall (1976).

Riemannian geometry is the branch of differential geometry that studies Riemannian manifolds, smooth manifolds with a Riemannian metric, i.e. with an inner product on the tangent space at each point that varies smoothly from point to point. This gives, in particular, local notions of angle, length of curves, surface area and volume.

riemannian geometry like the Gauss-Bonnet theorem are thus missing from this presentation. This is an even more severe limitation in the cases of contact and symplectic geometry, as we will discuss in their respective chapters. For this reason, we will avoid the use of the term "manifold" altogether. This will have some unfortunate consequences in terminology.

tool in differential geometry. Remark 1.2. If the dimension of  $M$  is zero, then  $M$  is a countable set equipped with the discrete topology (every subset of  $M$  is an open set). If  $\dim M = 1$ , then  $M$  is locally homeomorphic to an open interval; if  $\dim M = 2$ , then it is locally homeomorphic to an open disk, etc. (a) (b) (c) Figure 1.

Contact Manifolds is a local contact form, and taking charts on  $P T \hat{=} M$  defined by  $p \hat{=} i = 0$ , we obtain a contact structure in the wider sense. 5 we will briefly consider the geometry of the projectivized tangent bundle of the Beltrami model of the hyperbolic plane.

A collection  $f_1, f_2, \dots, f_k$  of functions with the properties stated in Theorem 1.2 is referred to as a finite partition of unity subordinate to the open cover  $V$  of the manifold  $M$ . Suppose that  $M$  is a (not necessarily compact) smooth manifold.

a Riemannian metric, a complex structure or a symplectic form. There is an extension of the notion of vector

eld that we shall need later on: Definition. Let  $\tilde{E}: M \rightarrow N$  be a map. A vector field along  $\tilde{E}$  is a map  $X: M \rightarrow TN$  with  $X(m) \in T\tilde{E}(m)$ ; for all  $m \in M$ , which additionally satisfies a smoothness assumption that we shall gloss over.
