### Section 6 - Ion Implantation

Chapter 6 Ion Implantation \_\_\_\_\_ 6.0 Introduction Ion implantation has been the dominating doping technique for silicon integrated circuit for past 30 years. It is expected to remain as the mean for doping technique for the foreseeable future. Like diffusion process, it is a

CHAPTER 9: Ion Implantation. Ion implantation is a low-temperature technique for the introduction of impurities. (dopants) into semiconductors and offers more flexibility than diffusion. For. instance, in MOS transistors, ion implantation can be used to accurately adjust. the threshold voltage.

- To familiarize students with SRIM software used for numerical simulation of ion implantation. - To perform numerical simulation of ion doping of planar structure of bipolar transistor. 5.2. Principles 5.2.1. Parameters of ion-doped layer Ion implantation is the main doping method used for fabrication of in microelectronic devices.

Advantages of Ion Implantation: 1.) Very precise control of the dose 2.) Independent control of impurity depth and dose 3.) Very fast (1 12" wafer can take as little as 25 seconds for a moderate dose) 4.) Can perform retrograde profiles that peak at points inside the wafer (as opposed to the wafer surface).
